**Report** : I have used a Selenium Webdriver Extension named Katalon Recorder. It is one of the Selenium recorder which allows us to record and playback web application in any browser. I have used Chrome browser. It gives us the flexibility to generate test cases in different frameworks using "Export" button. I have used this website [WebsiteLink](). First I clicked the new button to create a new Test suite. Then I hit record button and went to the website and logged in and logged out with Id and password. There are command lines like assert, click , type and we can use it to make the better use. We can use select button and hover on any component and click it and thus we will see an extra row generated with command, target and value (if it has any). Again we can select any event and click find and highlights button and thus we can see the corresponding event in log. We can also see a "test case passed" written on log if the test is successful. We can also see the Play button . If we click it,  it will  go to the website and show us the tested components again ,In one words it will give us the flashback of what has been tested with this automated tool. So all in all we can say that this Katalon record in very handy in terms of regression testing or smoke testing and non technical member can also use it with not much coding knowledge.
